Through the

use of virtualization and disk cache, the TS7700 family operates at disk speeds while maintaining compatibility with existing tape operations. Its fully integrated tiered storage hierarchy takes advantage of both disk and tape technologies to deliver performance for active data and best economics for inactive and archive data. This IBM Redbooks® publication describes the TS7700 R3.3 architecture, planning, migration, implementation, and operations. The latest TS7700 family of z Systems tape virtualization is offered as two models: IBM TS7720 features encryption-capable high-capacity cache that uses 3 TB SAS disk drives with RAID 6, which can scale to large capacities with the highest level of data protection. IBM TS7740 features encryption-capable 600 GB SAS drives with RAID 6 protection. Both models write data by policy to physical tape through attachment to high-capacity, high-performance IBM TS1150 and earlier IBM 3592 model tape drives that are installed in IBM TS3500 tape libraries. Physical tape support is optional on TS7720. TS7700 R3.3 also supports external key management for disk-based encryption by using IBM Security Key Lifecycle Manager. Dec 14 2020 Seminar paper from the year 2000 in the subject Computer Science - Commercial Information Technology, grade: 2,3 (B), UNITEC New Zealand (Information Systems), course: Course Internet & Intranet Management, 16 entries in the bibliography, language: English, abstract: The secondary school UniSec is going to upgrade its network on campus. With 1500 students enrolled and a total of 225 computers, the school recognises the need for the appliance of an appropriate Intranet and Internet technology. The current situation at the school shows already existing facilities that could be of use for a new implementation or an upgrade: There are six computer labs of both Macintosh and PC computers, which run either on MacOS 8 or Windows 98. The computers share a peer-to-peer Ethernet network for file sharing whereas no servers are involved that could establish print and file sharing facilities for the students. Microsoft products are installed on the students' computers. Furthermore there are 25 PC computers running on a Windows 98 platform for administrative purposes. Their interconnection bases on a client-server model that allows the staff to share printers and files. The server is NT-based. Within that network there is a human resource application that is running on a MS SQL-Server platform, which is located on the only server at school. In addition the staff

uses the accounting application MYOB, that is running only on the PC based hosts.

DHCP for Windows 2000 Jan 03 2020 Dynamic Host Configuration Protocol (DHCP) is an open standard Internet protocol used to allocate and manage IP addresses dynamically. Before DHCP came along, administrators had to manually configure each host on a network with an IP address, subnet mask, and default gateway. Maintaining

the changes and the associated logs took a tremendous amount of time and was prone to error. DHCP uses a client/server model in which the system updates and maintains the network information dynamically. Windows 2000 provides enhanced DHCP client-server support. DHCP for Windows 2000 is custom-designed for system administrators who are responsible for configuring and maintaining networks with Windows 2000 servers. It explains the DHCP protocol and how to install and manage DHCP on both servers and clients--including client platforms other than Windows 2000. Readers get detailed and explicit instructions for using Windows 2000 DHCP to manage their network IP configurations much more efficiently and effectively. They get background information for using DHCP in general, plus complete information about the Windows 2000 use of DHCP. For those interested in what's on the horizon, the author steps up to the plate with an analysis of the future direction of DHCP and Windows support for IPv6.
