scholars of Chinese philosophy often presuppose that early China possessed a naturalistic worldview, devoid of any non-natural concepts, such as transcendence. Challenging this presupposition head-on, Joshua R. Brown and Alexis McLeod argue that non-naturalism and transcendence have a robust and significant place in early Chinese thought. This book reveals that non-naturalist positions can be found in early Chinese texts, in topics including conceptions of the divine, cosmogony, and apophatic philosophy. Moreover, by closely examining a range of early Chinese texts, and providing comparative readings of a number of Western texts and thinkers, the book offers a way of reading early Chinese Philosophy as consistent with the religious philosophy of the East and West, including the Abrahamic and the Brahmanistic religions. Co-written by a philosopher and theologian, this book draws out unique insights into early Chinese thought, highlighting in particular new ways to consider a range of Chinese concepts, including tian, dao, li, and you/wu.

How People Learn Oct 19 2021 First released in the Spring of 1999, *How People Learn* has been expanded to show how the theories and insights from the original book can translate into actions and practice, now making a real connection between classroom activities and learning behavior. This edition includes far-reaching suggestions for research that could increase the impact that classroom teaching has on actual learning. Like the original edition, this book offers exciting new research about the mind and the brain that provides answers to a number of compelling questions. When do infants begin to learn? How do experts learn and how is this different from non-experts? What can teachers and schools do-with curricula, classroom settings, and teaching methods--to help children learn most effectively? New evidence from many branches of science has significantly added to our understanding of what it means to know, from the neural processes that occur during learning to the influence of culture on what people see and absorb. *How People Learn* examines these findings and their

implications for what we teach, how we teach it, and how we assess what our children learn. The book uses exemplary teaching to illustrate how approaches based on what we now know result in in-depth learning. This new knowledge calls into question concepts and practices firmly entrenched in our current education system. Topics include: How learning actually changes the physical structure of the brain. How existing knowledge affects what people notice and how they learn. What the thought processes of experts tell us about how to teach. The amazing learning potential of infants. The relationship of classroom learning and everyday settings of community and workplace. Learning needs and opportunities for teachers. A realistic look at the role of technology in education.

Science as a Way of Knowing Jul 04 2020

Science was not always the dominant way of knowing, as we see in this spirited exploration of how human beings over the millennia have sought to understand the phenomena of life. Central to the puzzle are several questions: How did living matter arise, and how does it reproduce itself? How does life develop from a single cell into a complex organism? And how did the vast variety of species we see around us, and those long-extinct, come to be? One of the intellectual wonders of our time has been biologists' gradual untangling of these great mysteries, beginning with the investigations of Aristotle and the Greeks, continuing through the experiments and theories of Darwin and his contemporaries, and culminating in the researches of geneticists, developmental biologists, paleontologists, and other specialists in the twentieth century. For more than twenty years John Moore has taught biology instructors how to teach biology - by emphasizing the questions people have asked about life through the ages and the ways natural philosophers and scientists have sought the answers. This book makes Moore's uncommon wisdom available to the general reader in a lively and richly illustrated account of the history and workings of life. Employing a breadth of rhetorical strategies - including vividly written case histories, hypotheses and deductions, and chronological narrative - *Science as a Way of Knowing* provides not only a cultural history of biology but also a splendid introduction to the

procedures and values of science. This book's interpretive, nontechnical approach to the sciences of life will delight and inform anyone curious about what we knew and when we knew it. It is indispensable reading for the nonspecialist seeking a deeper understanding of how modern molecular biology, ecology, and biotechnology came to be.

A Taxonomy for Learning, Teaching, and Assessing Oct 07 2020 This revision of Bloom's taxonomy is designed to help teachers understand and implement standards-based curriculums. Cognitive psychologists, curriculum specialists, teacher educators, and researchers have developed a two-dimensional framework, focusing on knowledge and cognitive processes. In combination, these two define what students are expected to learn in school. Like no other text, it explores curriculums from three unique perspectives--cognitive psychologists (learning emphasis), curriculum specialists and teacher educators (C&I emphasis), and measurement and assessment experts (assessment emphasis). This "revisited" framework allows you to connect learning in all areas of curriculum. Educators, or others interested in Educational Psychology or Educational Methods for grades K-12.
