*Water and Aqueous Solutions at Subzero Temperatures* Feb 26 2022 This Volume, the last of the series, is devoted to water in its metastable forms, especially at sub-zero temperatures. The past few years have witnessed an increasing interest in supercooled water and amorphous ice. If the properties of liquid water in the normal temperature range are already eccentric, then they become exceedingly so below the normal freezing point, in the metastable temperature range. Water can be supercooled to -39°C without too much effort, and most of its physical properties show a remarkable temperature dependence under these conditions. Although adequate explanations are still lacking, the time has come to review available knowledge. The study of amorphous ice, that is, the solid formed when water vapor is condensed on a very cold surface, is of longer standing. It has achieved renewed interest because it may serve as a model for the liquid state. There is currently a debate whether or not a close structural relationship exists between amorphous ice and supercooled water. The nucleation and growth of ice in supercooled water and aqueous solutions is also still one of those grey areas of research, although these topics have received considerable attention from chemists and physicists over the past two decades. Even now, the relationships between degree of supercooling, nucleation kinetics, crystal growth kinetics, cooling rate and solute concentration are somewhat obscure. Nevertheless, at the empirical level much progress has been made, because these topics are of considerable importance to biologists, technologists, atmospheric physicists and glaciologists.

**Out of Focus** Jun 08 2020 Television is the most influential medium in the history of mankind. More Americans own a TV than have telephones or indoor plumbing. We are 13 times more likely to watch television than read a newspaper or magazine. What Americans watch on the "tube" is what Americans, to a significant extent, learn about life, their society and their nation. Of this there is no dispute. TV profoundly affects its viewers' attitudes on violence, sex, women, gays, and other hotly-debated social issues of our day. In *Out of Focus: Network Television and the American Economy*, Pines and Lamer examine TV's accuracy in portraying the American economy. What they find is disturbing. According to *Out of Focus*, what viewers see on TV is the American free-enterprise system distorted into a tale of catastrophes, bankruptcies, fraud, and ineptitude, populated by white businessmen who are criminals and conmen, and consumers who are stupid, gullible, and powerless. It is not surprising, then, that Americans don't understand much about their economy, and for this, network television shares much of the blame. So concludes *Out of Focus*, with an unprecedented, comprehensive analysis of all network television newscasts in 1992 and a quarter of the year's entertainment programming. Unfortunately, most Americans' only source of economic information comes from their daily dose of TV (an average of 4 hours a day), and dangerous misinformation affects their personal financial decisions and their outlook on government policy. Pines sets out to end this misinformation in *Out of Focus*. Naming names, Pines ranks the year's best and worst economic reporters and stories. He also offers sound solutions both for journalists to improve their coverage of economic issues and for viewers to improve the quality of what they watch.

**Earth Vibration Effects and Abatement for Military Facilities** Aug 11 2020 Over the past few years, it has been demonstrated that the self-excited vibratory motion of a circular footing on various types of soil can be successfully predicted by mathematical model derived by assuming that the foundation soil is represented by a homogeneous elastic half-space. This finding suggested that the same model, or variations thereof, might be useful for predicting the particle motion generated within a soil foundation by a vibrating footing. The objective of this study was to test the hypothesized utility of the half-space model for predicting the motion field generated in a natural soil deposit by the forced torsional vibration of a circular footing. The test involved the computation of half-space motion, the measurement of soil motion, and a comparison of the computations to the measurements. (Author).

*Food and Society* Jan 16 2021 *Food and Society* provides a broad spectrum of information to help readers understand how the food industry has evolved from the 20th century to present. It includes information anyone would need to prepare for the future of the food industry, including discussions on the drivers that have, and may, affect food supplies. From a historical perspective, readers will learn about past and present challenges in food trends, nutrition, genetically modified organisms, food security, organic foods, and more. The book offers different perspectives on solutions that have worked in the past, while also helping to anticipate future outcomes in the food supply. Professionals in the food industry, including food scientists, food engineers, nutritionists and agriculturalists will find the information comprehensive and interesting. In addition, the book could even be used as the basis for the development of course materials for educators who need to prepare students entering the food industry. Includes hot topics in food science, such as GMOs, modern agricultural practices and food waste Reviews the role of food in society, from consumption, to politics, economics and social trends Encompasses food safety, security and public health Discusses changing global trends in food preferences

**Digital Matters** Jun 20 2021 Analyzing the complex interaction between the material and immaterial aspects of new digital technologies, this book draws upon a mix of theoretical approaches (including sociology, media theory, cultural studies and technological philosophy), to suggest that the 'Matrix' of science fiction and Hollywood is simply an extreme example of how contemporary technological society enframes and conditions its citizens. Arranged in two parts, the book covers: theorizing the Im/Material Matrix living in the Digital Matrix. Providing a novel perspective on on-going digital developments by using both the work of current thinkers and that of past theorists not normally associated with digital issues, it gives a fresh insight into the roots and causes of the social matrix behind the digital one of popular imagination. The authors highlight the way we should be concerned by the power of the digital to undermine physical reality, but also explore the potential the digital has for alternative, empowering social uses. The book's central point is to impress upon the reader that the digital does indeed matter. It includes a pessimistic interpretation of technological change, and adds a substantial historical perspective to the often excessively topical focus of much existing cyberstudies literature making it an important volume for students and researchers in this field.
