The Search for Fundamentals Jul 16 2021 Modernity dissolves absolute certainties; late modernity dissolves them absolutely. In the modern world system there appears to be no firm, unchallenged ground on which to construct a meaningful canopy. But around the world, many individuals and groups long for a kind of cultural coherence that they believe once existed. They search for fundamentals. While these may be sought in religious traditions, many also aspire to new secular certainties. In their various new forms and contexts the contemporary quests for meaning in turn transform the societies in which they occur. The rich comparative examples in *The Search for Fundamentals* are used to analyze the sources and consequences of several cultural movements. The book also offers theoretical reflections on the difficulties they experience and on the message they carry for students of modernity. Audience: A broad readership of scholars and advanced students in the social sciences and humanities.

Fundamentals of III-V Semiconductor MOSFETs Jun 02 2020 Fundamentals of III-V Semiconductor MOSFETs presents the fundamentals and current status of research of compound semiconductor metal-oxide-semiconductor field-effect transistors (MOSFETs) that are envisioned as a future replacement of silicon in digital circuits. The material covered begins with a review of specific properties of III-V semiconductors and available technologies making them attractive to MOSFET technology, such as band-engineered heterostructures, effect of strain, nanoscale control during epitaxial growth. Due to the lack of thermodynamically stable native oxides on III-V's (such as SiO₂ on Si), high-k oxides are the natural choice of dielectrics for III-V MOSFETs. The key challenge of the III-V MOSFET technology is a high-quality, thermodynamically stable gate dielectric that passivates the interface states, similar to SiO₂ on Si. Several chapters give a detailed description of materials science and electronic behavior of various dielectrics and related interfaces, as well as physics of fabricated devices and MOSFET fabrication technologies. Topics also include recent progress and understanding of various materials systems; specific issues for electrical measurement of gate stacks and FETs with low and wide bandgap channels and high interface trap density; possible paths of integration of different semiconductor materials on Si platform.
